

IN THE SPECIFICATION

Please replace paragraph 2 with the following rewritten paragraph:

The present invention generally relates to processing apparatus having recomposable software ~~program recombining by means of external approach and methods for recombining the program~~. In particular, the present invention relates to processing apparatus and program recomposing ~~recombining~~ methods for use, for example, in an inspecting apparatus and a measuring instrument that inspects and measures a print baseboard and peripheral equipment, and capable of building software with less development cost and knowledge related to programming, while maintaining software (i.e., program) code even when processing and procedure are different.

Please replace paragraph 28 with the following rewritten paragraph:

In another embodiment, a computer system may include a processor, recomposable ~~recombining~~ software, a memory for storing data and program used by the processor, an inputting apparatus for allowing data input, and a display for displaying at least input data and processing resultant. An editing section may be provided so as to select a function of a control section and edit a processing sequence based upon input through the inputting apparatus. A sequence control section may also be provided so as to perform a control operation in accordance with the processing sequence edited by the editing section. A function control section may be provided so as to execute at least controlling of a control section and an internal operation in accordance with a control instruction set by the editing section. A peripheral equipment control section may be provided so as to control a peripheral equipment under control of the function control section in accordance with a control instruction set by the editing section. A peripheral equipment communication section may be

provided so as to communicate with the peripheral equipment under control of the function control section in accordance with a control instruction set by the editing section.

Please replace paragraph 30 with the following rewritten paragraph:

In yet another embodiment, a general-purpose inspecting system may inspect a peripheral unit connected to an input-output interface with recomposable ~~recombinable~~ software in accordance with a peripheral unit to be inspected. A debugging means may be provided so as to read inspection operation confirming information during an execution of inspecting the peripheral unit and to display it on a screen.

Please replace paragraph 34 with the following rewritten paragraph:

Fig. 1 is a schematic chart illustrating the entire configuration of an exemplary processing apparatus including a recomposable ~~recombinable~~ software according to the first embodiment of the present invention;
